3 (Sem-5) CHM M 3

2014

CHEMISTRY

(Major)

Paper : 5.3

Full Marks: 60

Time : 3 hours

The figures in the margin indicate full marks for the questions

1. Answer the following questions : 1×7=7

 (a) Arrange the following in order of increasing migratory aptitude in a
 pinacol rearrangement :

> *p*-Chlorophenyl, *p*-tolyl, *p*-methoxyphenyl, phenyl

- (b) How can you convert nitrobenzene to azobenzene?
- (c) Write the product, taking care of stereochemistry :

A15-1100/244

(Turn Over)

ś M MH (8-mes) (62)

- (d) Give one natural source each for pyrrole and pyridine.
- (e) $C_{3}H_{7}NO_{2}$ is a nitroalkane. It reacts with nitrous acid to form a colourless compound which turns red when sodium hydroxide solution is added. What is the possible structure of the parent compound?
- (f) Which is more acidic CH₃SH or CH₃OH? Why?
- (g) Which one of the following two compounds will exhibit scrambling in a Favorskii rearrangement?

- 2. Answer the following questions (any four) : 2×4=8
 - (a) What is Raney nickel? Write the appropriate product for the following reaction :

A15-1100/244

(Continued)

- (3)
- (b) State whether the given reactions are thermally allowed or photochemically allowed :

- (c) Which position(s) of quinoline undergo nucleophilic aromatic substitution?
- (d) 'Pyridinium ion' is about as strong an acid as carboxylic acid. Explain.
- (e) What is mustard gas? What is the cause of its toxicity?
- 3. Answer any three of the following questions [any one from (a) and (b), any two from (c), (d) and (e)]: 5×3=15
 - (a) How can you convert acetic acid to propanoic acid, using a rearrangement reaction? Name the rearrangement.
 Write the mechanism of the rearrangement reaction. 2+1+2

A15-1100/244

(Turn Over)

(5)

4. Answer the following questions : $10 \times 3 = 30$

Either

(a) (i) Predict the product in each case and write the mechanistic steps involved : 2+3

 (ii) Diels-Alder reaction is stereoselective. Explain. Work out the diene and dienophile components in the given compound : 4+1

Or

(b) (i) Use HOMO-LUMO approach to show that [4+2] cycloaddition is thermally allowed.

(Turn Over)

5

 (b) What will happen if 3-hydroxy-1,5-diene is heated? Propose a mechanism. Write the product(s) expected to be formed in the following reaction : 2+2+1

$$\square \xrightarrow{ } ?$$

- (c) (i) Acetoacetic ester has two structures which are readily interconvertible. Write down the structures.
 - (ii) How is ethyl cyanoacetate prepared? 2
 - *(iii)* Write the reactions involved in the preparation of adipic acid from diethyl malonate.
 - (d) Account for the observation that *ortho*-, *para*-directing substituents on the 1-position of naphthalene directs substituents to 2- and 4-positions, whereas the same substituent on the 2-position directs substitution almost exclusively to the 1-position.
 - (e) (i) Write the sequence of reactions involved in the Skraup synthesis of quinoline.
 - (ii) Which position of pyrrole undergoes aromatic electrophilic substitution easily and why?

A15-1100/244

(Continued)

1

2

5

3

2

(7)

- (d) (i) Propose a general mechanism for catalytic hydrogenation which can account for different types of product obtained in such a hydrogenation reaction.
 - (ii) How is Jones reagent different from Collins reagent? Propose a mechanism for the conversion of a primary alcohol to aldehyde with a Cr(VI) reagent.

Either

- (e) (i) Suggest a method for preparation of alkyl isocyanides.
 - (ii) Alkyl isocyanides are insoluble in water. Why?

A15-1100/244

(Turn Over)

 (ii) Give the product of the following reaction, name the rearrangement and propose a mechanism : 1+1+3

Either

Account for the product obtained in each case. $2\frac{1}{2}+2\frac{1}{2}$

(ii) Identify A, B, C, D and E in the following reactions : 1×5=5

A15-1100/244

(c)

(Continued)

2+3

2

1

5

- *(iii)* Give two reactions which show the reducing property of alkyl isocyanides.
- (iv) Identify A, B, C, D and E from the following : 2¹/₂

$$H_{3C} \xrightarrow{1) \text{HNO}_{3}, \text{H}_{2}\text{SO}_{4}} A \xrightarrow{\text{Ac}_{2}\text{O}} B$$

$$H_{3C} \xrightarrow{1) \text{H}_{2}/\text{Pd}-\text{C}} A \xrightarrow{\text{B}_{2}} B$$

$$E \xleftarrow{1) \text{NaNO}_{2}, \text{HCl}} D \xleftarrow{\text{NaOH}} C$$

(v) Write the mechanism for diazotization of a primary amine. 2¹/₂

Or

- (f) (i) Describe a method for synthesis of pyrrole. 3
 - (*ii*) Give the products in each of the following reactions :

(iii) What are stabilized and nonstabilized ylides? Propose a mechanism for Wittig reaction. 2+3

* * *
